

DOSING-UNIT | PRE-MIX STATION | HOLDING TANK

Dosing stations are suitable for all applications in which liquid media must be mixed continuously and with maximum precision!

- Each dosing station is tailored exactly to the respective application
- The individual station can be equipped with up to five strings
- Five or more additives per strand are possible
- The dosing stations are specially designed for mixing pumpable media of different viscosity, as they can be operated at different speeds depending on the product
- Mixtures according to inline pH-value and viscosity measurements are possible
- As there are only minimal quantities in the mixing system, only the smallest quantities of waste need to be disposed of
- An additional advantage is the avoidance of ageing processes of the material. You can always work with fresh products of consistent quality. Since each dosing station is tailored to your individual requirements, dimensions and performance ranges are application-dependent
