## Vacuum Filler

Our vacuum filler features a unique fill principle, consisting of four filling phases: vacuum, fill, vacuum-fill and vent to atmosphere. During the vacuum-fill phase, vacuum is applied while filling continues. This “topping-off” phase ensures that any remaining air is effectively removed and replaced with liquid. The vacuum filler is ideally suited to fill low viscous products without particles or with small particles into a rigid, wide-mouth container that has previously been filled with a solid or granular product.

ERROR fo  
Invalid do

- Effective removal of residual air and replacement with liquid
- Highly robust execution
- Special tuna execution

## DETAILS

- Some typical applications that require vacuum to remove air from a pre-filled container:
- Vacuum packed corn
- Brine-packed vegetables
- Brine-packed or oil-packed tuna
- Sauces and soups
- Syrups on fruits
